MSP430F525x Mixed-Signal Microcontrollers

1 Device Overview

1.1 Features

- Dual-Supply Voltage Device
  - Primary Supply (AVCC, DVCC)
    - Powered From External Supply: 3.6 V Down to 1.8 V
    - Up to 18 General-Purpose I/Os With up to 8 External Interrupts
  - Low-Voltage Interface Supply (DVIO)
    - Powered From Separate External Supply: 1.62 V to 1.98 V
    - Up to 35 General-Purpose I/Os With up to 16 External Interrupts
    - Serial Communications
- Ultra-Low Power Consumption
  - Active Mode (AM): All System Clocks Active 290 µA/MHz at 8 MHz, 3.0 V, Flash Program Execution (Typical) 150 µA/MHz at 8 MHz, 3.0 V, RAM Program Execution (Typical)
  - Standby Mode (LPM3): Real-Time Clock (RTC) With Crystal, Watchdog, and Supply Supervisor Operational, Full RAM Retention, Fast Wakeup: 2.1 µA at 2.2 V, 2.3 µA at 3.0 V (Typical) Low-Power Oscillator (VLO), General-Purpose Counter, Watchdog, and Supply Supervisor Operational, Full RAM Retention, Fast Wakeup: 1.6 µA at 3.0 V (Typical)
  - Off Mode (LPM4): Full RAM Retention, Supply Supervisor Operational, Fast Wakeup: 1.3 µA at 3.0 V (Typical)
  - Shutdown Mode (LPM4.5): 0.18 µA at 3.0 V (Typical)
- Wake up From Standby Mode in 3.5 µs (Typical)
- 16-Bit RISC Architecture, Extended Memory, up to 25-MHz System Clock
- Flexible Power-Management System
  - Fully Integrated LDO With Programmable Regulated Core Supply Voltage
  - Supply Voltage Supervision, Monitoring, and Brownout
- Unified Clock System
  - FLL Control Loop for Frequency Stabilization
  - Low-Power Low-Frequency Internal Clock Source (VLO)
  - Low-Frequency Trimmed Internal Reference Source (REFO)
  - 32-kHz Watch Crystals (XT1)
  - HF Crystals up to 32 MHz (XT2)
- 16-Bit Timer TA0, Timer_A With Five Capture/Compare Registers
- 16-Bit Timer TA1, Timer_A With Three Capture/Compare Registers
- 16-Bit Timer TA2, Timer_A With Three Capture/Compare Registers
- 16-Bit Timer TB0, Timer_B With Seven Capture/Compare Shadow Registers
- Four Universal Serial Communication Interfaces
  - USCI_A0, A1, A2, A3 Each Support:
    - Enhanced UART With Automatic Baud-Rate Detection
    - IrDA Encoder and Decoder
    - Synchronous SPI
  - USCI_B0, B1, B2, B3 Each Support:
    - I^2C
    - Synchronous SPI
- 10-Bit Analog-to-Digital Converter (ADC) With Internal Reference, Sample-and-Hold
- Comparator
- Hardware Multiplier Supports 32-Bit Operations
- Serial Onboard Programming, No External Programming Voltage Needed
- 3-Channel Internal DMA
- Basic Timer With RTC Feature
- Device Comparison Summarizes the Available Family Members and Packages

1.2 Applications

- "Always-On" System Controllers
- Power-Management Hubs
- *Bluetooth*® Controllers
- Analog and Digital Sensor Fusion Systems
- Data Loggers
- General-Purpose Applications

1.3 Description

Using an "always-on" ultra-low-power system controller can significantly reduce power consumption on portable devices like handsets and tablets. These controllers can act as sensor hubs and monitor user stimuli (for example, reading inertial sensors or touch sensors) and vital system parameters like battery health and temperature, while power-hungry application processors and touch screen controllers are turned off. The microcontroller can then "wake up" the system based on a user input or on a fault condition that requires CPU intervention.

The MSP430F525x series is the latest addition to the 1.8-V split-rail I/O portfolio (previously only available on MSP430F522x) and is specifically designed for "always-on" system controller applications. 1.8-V I/O allows for seamless interface to application processors and other devices without the need for external level translation, while the primary supply to the MCU can be on a higher voltage rail.

Compared to the MSP430F522x, the MSP430F525x provides up to four times more RAM (32KB) and double the serial interfaces (four USCI_A and four USCI_B). The MSP430F525x also features four 16-bit timers, a high-performance 10-bit ADC, a hardware multiplier, DMA, a comparator, and an RTC module with alarm capabilities. The MSP430F525x consumes 290 µA/MHz (typical) in active mode running from flash memory, and it consumes 1.6 µA (typical) in standby mode (LPM3). The MSP430F525x can switch to active mode in 3.5 µs (typical), which makes it a great fit for "always-on" low-power applications.

Key benefits of the MSP430F525x are as follows:

- Up to 32KB of RAM allows complex sensor hub algorithms and high levels of aggregation such as keyboard control and power management.
- Four USCI_A and four USCI_B modules allow for eight concurrent dedicated hardware serial interfaces (for example, four I^2C and four SPI) for fast and robust communication to sensors or peripheral devices.
- Up to 35 I/Os that can be used in the 1.8-V voltage rail.

2 Revision History

NOTE: Page numbers for previous revisions may differ from page numbers in the current version.

Changes from November 26, 2015 to September 27, 2018 **Page**

- Added Section 3.1, *Related Products* 6
- Added color to P1.0 (pin H2) and DVSS (pin F9) to indicate supply from DVIO in Figure 4-2, *80-Pin ZQE Package (Top View)* 8
- Added typical conditions statements at the beginning of Section 5, *Specifications* 14
- Changed the MIN value of the $V_{(DVCC\_BOR\_hys)}$ parameter from 60 mV to 50 mV in Section 5.26, *PMM, Brownout Reset (BOR)* 30
- Updated notes (1) and (2) and added note (3) in Section 5.32, *Wake-up Times From Low-Power Modes and Reset* 33
- Removed ADC10DIV from the formula for the TYP value in the second row of the $t_{CONVERT}$ parameter in Section 5.42, *10-Bit ADC, Timing Parameters*, because ADC10CLK is after division 40
- Added second row for t_{EN_CMP} with Test Conditions of "CBPWRMD = 10" and MAX value of 100 µs in Section 5.46, *Comparator_B* 43
- Renamed FCTL4.MGR0 and MGR1 bits in the $f_{MCLK,MGR}$ parameter in Section 5.47, *Flash Memory*, to be consistent with header files 44
- Added links to the custom BSL430 package download in Section 6.5, *Bootloader (BSL)* 50
- Replaced former section *Development Tools Support* with Section 7.3, *Tools and Software* 97
- Updated list of related documentation in Section 7.4, *Documentation Support* 99

(3) Each number in the sequence represents an instantiation of Timer_A with its associated number of capture compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer_A, the first instantiation having 3 and the second instantiation having 5 capture compare registers and PWM output generators, respectively.
(4) Each number in the sequence represents an instantiation of Timer_B with its associated number of capture compare registers and PWM output generators available. For example, a number sequence of 3, 5 would represent two instantiations of Timer_B, the first instantiation having 3 and the second instantiation having 5 capture compare registers and PWM output generators, respectively.
(5) All of these I/Os are on a single voltage rail supplied by DVCC.
(6) All of these I/Os are on a single voltage rail supplied by DVIO.

(7) This pin is configurable as reset or NMI and resides on the DVIO supply domain. When driven from external, the input swing levels from DVSS to DVIO are required.
(8) When this pin is configured as reset, the internal pullup resistor is enabled by default.
(9) When in crystal bypass mode, XT2IN can be configured so that it can support an input digital waveform with swing levels from DVSS to DVCC or DVSS to DVIO. In this case, the must pin be configured properly for the intended input swing.
(10) See Section 6.5.1 and Section 6.6 for use with BSL and JTAG functions, respectively.
(11) See Section 6.6 for use with JTAG function.
(12) This nonconfigurable reset resides on the DVCC supply domain and has an internal pullup to DVCC. When driven from external, input swing levels from DVSS to DVCC are required. This reset must be used for Spy-Bi-Wire communication and is not the same $\overline{\text{RST}}$/NMI reset as found on other devices in the MSP430 family. Refer to Section 6.5.1 and Section 6.6 for details regarding the use of this pin.
(13) C6, D4, D5, D6, E3, E4, E5, E6, F3, F4, F5, F6, F7, F8, G3 are reserved and should be connected to ground.

5 Specifications

All graphs in this section are for typical conditions, unless otherwise noted.

Typical (TYP) values are specified at V_{CC} = 3.3 V and T_A = 25°C, unless otherwise noted.

5.1 Absolute Maximum Ratings(1)

over operating free-air temperature range (unless otherwise noted)

	MIN	MAX	UNIT
Voltage applied at V_{CC} to V_{SS}	–0.3	4.1	V
Voltage applied at V_{IO} to V_{SS}	–0.3	2.2	V
Voltage applied to any pin (excluding VCORE and V_{IO} pins)(2)	–0.3	V_{CC} + 0.3	V
Voltage applied to V_{IO} pins	–0.3	V_{IO} + 0.2	V
Diode current at any device pin		±2	mA
Storage temperature, T_{stg}(3)	–55	150	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
(2) All voltages referenced to V_{SS}. VCORE is for internal device use only. No external DC loading or voltage should be applied.
(3) Higher temperature may be applied during board soldering according to the current JEDEC J-STD-020 specification with peak reflow temperatures not higher than classified on the device label on the shipping boxes or reels.

5.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001(1)	±1000	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101(2)	±250	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process. Pins listed as ±1000 V may actually have higher performance.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process. Pins listed as ±250 V may actually have higher performance.

5.3 Recommended Operating Conditions

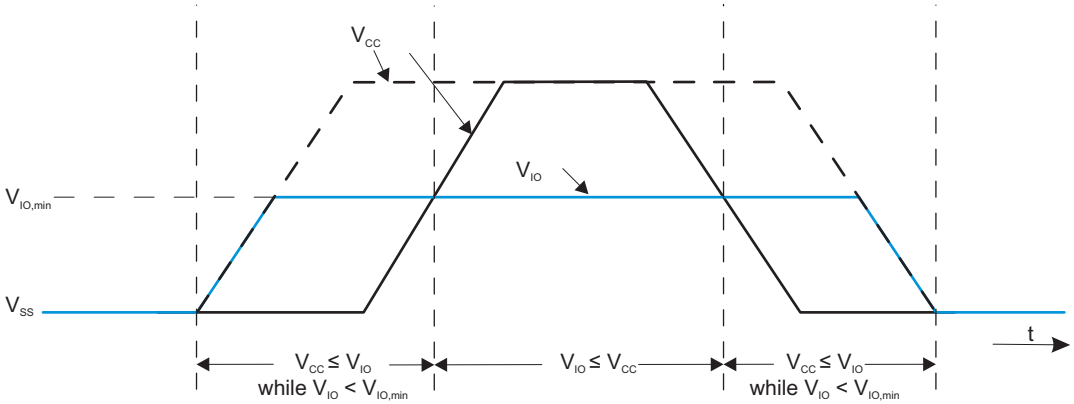
			MIN	NOM	MAX	UNIT
V_{CC}	Supply voltage during program execution and flash programming (AV_{CC} = DV_{CC})(1) (2) (3)	PMMCOREVx = 0	1.8		3.6	V
		PMMCOREVx = 0, 1	2.0		3.6	
		PMMCOREVx = 0, 1, 2	2.2		3.6	
		PMMCOREVx = 0, 1, 2, 3	2.4		3.6	
V_{IO}	Supply voltage applied to DVIO referenced to V_{SS} (2)		1.62		1.98	V
V_{SS}	Supply voltage (AV_{SS} = DV_{SS})			0		V
T_A	Operating free-air temperature		–40		85	°C
T_J	Operating junction temperature		–40		85	°C
C_{VCORE}	Recommended capacitor at VCORE(4)			470		nF
C_{DVCC}/ C_{VCORE}	Capacitor ratio of DVCC to VCORE		10			

(1) TI recommends powering AVCC and DVCC from the same source. A maximum difference of 0.3 V between AVCC and DVCC can be tolerated during power up and operation.
(2) During V_{CC} and V_{IO} power up, it is required that $V_{IO} \geq V_{CC}$ during the ramp up phase of V_{IO}. During V_{CC} and V_{IO} power down, it is required that $V_{IO} \geq V_{CC}$ during the ramp down phase of V_{IO} (see Figure 5-1).
(3) The minimum supply voltage is defined by the supervisor SVS levels when it is enabled. See the Section 5.28 threshold parameters for the exact values and further details.
(4) TI recommends a capacitor tolerance of ±20% or better.

Recommended Operating Conditions *(continued)*

			MIN	NOM	MAX	UNIT
f_{SYSTEM}	Processor frequency (maximum MCLK frequency)(5) (see Figure 5-3)	PMMCOREVx = 0 (default condition), 1.8 V ≤ V_{CC} ≤ 3.6 V	0		8.0	MHz
		PMMCOREVx = 1, 2.0 V ≤ V_{CC} ≤ 3.6 V	0		12.0	
		PMMCOREVx = 2, 2.2 V ≤ V_{CC} ≤ 3.6 V	0		20.0	
		PMMCOREVx = 3, 2.4 V ≤ V_{CC} ≤ 3.6 V	0		25.0	

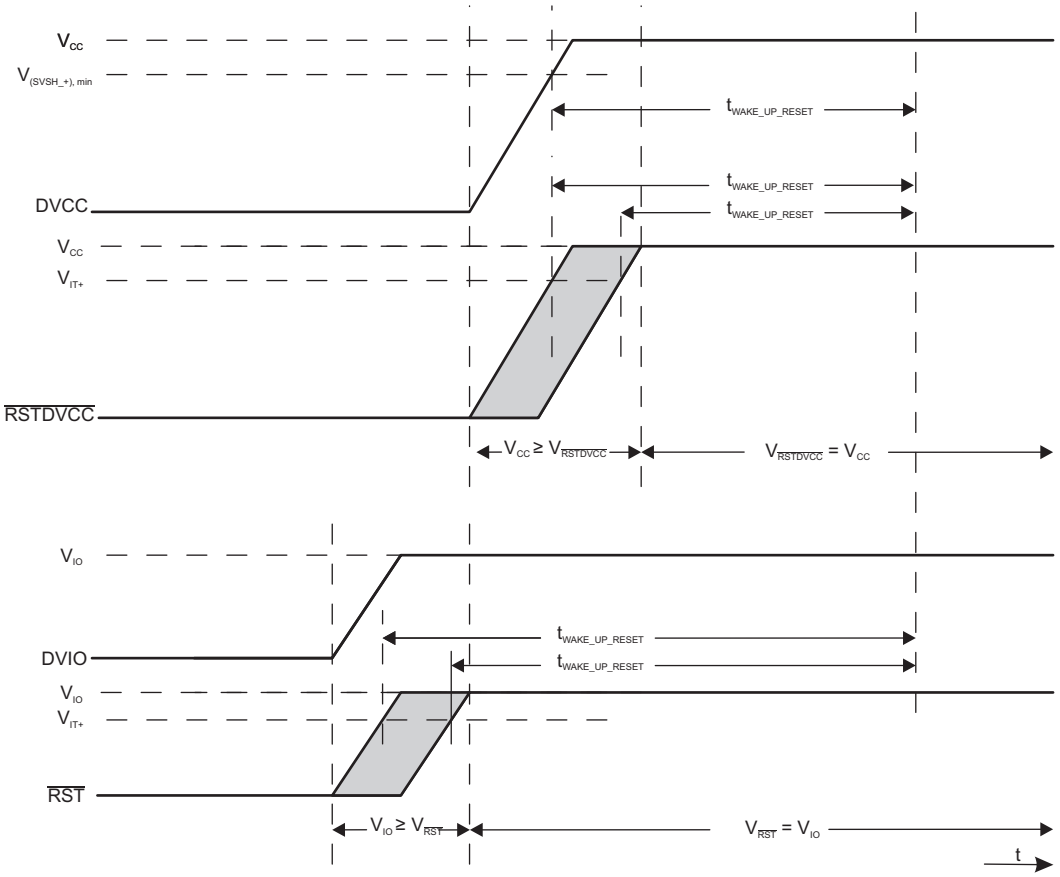
(5) Modules may have a different maximum input clock specification. See the specification of the respective module in this data sheet.



NOTE: The device supports continuous operation with $V_{CC} = V_{SS}$ while V_{IO} is fully within its specification. During this time, the general-purpose I/Os that reside on the V_{IO} supply domain are configured as inputs and pulled down to V_{SS} through their internal pulldown resistors. $\overline{RST}$/NMI is high impedance. BSLEN is configured as an input and is pulled down to V_{SS} through its internal pulldown resistor. When V_{CC} reaches above the BOR threshold, the general-purpose I/Os become high-impedance inputs (no pullup or pulldown enabled), $\overline{RST}$/NMI becomes an input pulled up to V_{IO} through its internal pullup resistor, and BSLEN remains pulled down to V_{SS} through its internal pulldown resistor.

NOTE: Under certain condtions during the rising transition of V_{CC}, the general-purpose I/Os that reside on the V_{IO} supply domain may actively transition high momentarily before settling to high-impedance inputs. These voltage transitions are temporary (typically resolving to high impedance inputs when V_{CC} exceeds approximately 0.9 V) and are bounded by the V_{IO} supply.

Figure 5-1. V_{CC} and V_{IO} Power Sequencing



NOTE: The device remains in reset based on the conditions of the $\overline{RSTDVCC}$ and $\overline{RST}$ pins and the voltage present on DVCC voltage supply. If $\overline{RSTDVCC}$ or $\overline{RST}$ is held at a logic low or if DVCC is below the SVSH_+ minimum threshold, the device remains in its reset condition; that is, these conditions form a logical OR with respect to device reset.

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	MAX	UNIT
$t_{(int)}$	External interrupt timing[1]	External trigger pulse duration to set interrupt flag	1.8 V, 3 V	20		ns

(1) An external signal sets the interrupt flag every time the minimum interrupt pulse duration $t_{(int)}$ is met. It may be set by trigger signals shorter than $t_{(int)}$.

5.10 Inputs – Interrupts DVIO Domain Ports P1 and P2 (P1.0 to P1.7, P2.0 to P2.7)

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{IO}[1]	MIN	MAX	UNIT
$t_{(int)}$	External interrupt timing[2]	External trigger pulse duration to set interrupt flag, V_{CC} = 1.8 V or 3.0 V	1.62 V to 1.98 V	20		ns

(1) In all test conditions, $V_{IO} \le V_{CC}$.
(2) An external signal sets the interrupt flag every time the minimum interrupt pulse duration $t_{(int)}$ is met. It may be set by trigger signals shorter than $t_{(int)}$.

5.11 Leakage Current – General-Purpose I/O DVCC Domain (P5.0 to P5.5, P6.0 to P6.7, PJ.0 to PJ.3)

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{CC}	MIN	MAX	UNIT
$I_{lkg(Px.y)}$	High-impedance leakage current	See (1)(2)	1.8 V, 3 V	–50	50	nA

(1) The leakage current is measured with V_{SS} or V_{CC} applied to the corresponding pins, unless otherwise noted.
(2) The leakage of the digital port pins is measured individually. The port pin is selected for input and the pullup or pulldown resistor is disabled.

5.12 Leakage Current – General-Purpose I/O DVIO Domain (P1.0 to P1.7, P2.0 to P2.7, P3.0 to P3.4, P4.0 to P4.7, P7.0 to P7.5)

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS	V_{IO}(1)	MIN	MAX	UNIT
$I_{lkg(Px.y)}$	High-impedance leakage current	See (2)(3)	1.62 V to 1.98 V	–50	50	nA

(1) In all test conditions, $V_{IO} \le V_{CC}$.
(2) The leakage current is measured with V_{SS} or V_{IO} applied to the corresponding pins, unless otherwise noted.
(3) The leakage of the digital port pins is measured individually. The port pin is selected for input and the pullup or pulldown resistor is disabled.

5.13 Outputs – General-Purpose I/O DVCC Domain (Full Drive Strength) (P5.0 to P5.5, P6.0 to P6.7, PJ.0 to PJ.3)

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

(1) A resistive divider with 2 × R1 between V_{IO} and V_{SS} is used as load. The output is connected to the center tap of the divider. For full drive strength, R1 = 550 Ω. For reduced drive strength, R1 = 1.6 kΩ. C_L = 20 pF is connected to the output to V_{SS}.
(2) The output voltage reaches at least 10% and 90% V_{IO} at the specified toggle frequency.
(3) In all test conditions, $V_{IO} \le V_{CC}$.

(1) To improve EMI on the XT1 oscillator, the following guidelines should be observed.
- Keep the trace between the device and the crystal as short as possible.
- Design a good ground plane around the oscillator pins.
- Prevent crosstalk from other clock or data lines into oscillator pins XIN and XOUT.
- Avoid running PCB traces underneath or adjacent to the XIN and XOUT pins.
- Use assembly materials and processes that avoid any parasitic load on the oscillator XIN and XOUT pins.
- If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.

(2) When XT1BYPASS is set, XT1 circuits are automatically powered down. Input signal is a digital square-wave with parametrics defined in the Schmitt-Trigger Inputs section of this data sheet. When in crystal bypass mode, XIN can be configured so that it can support an input digital waveform with swing levels from DVSS to DVCC (XT1BYPASSLV = 0) or DVSS to DVIO (XT1BYPASSLV = 1). In this case, it is required that the pin be configured properly for the intended input swing.

(3) Maximum frequency of operation of the entire device cannot be exceeded.

(4) Oscillation allowance is based on a safety factor of 5 for recommended crystals. The oscillation allowance is a function of the XT1DRIVEx settings and the effective load. In general, comparable oscillator allowance can be achieved based on the following guidelines, but each application should be evaluated based on the actual crystal selected:
- For XT1DRIVEx = 0, $C_{L,eff} \le 6$ pF
- For XT1DRIVEx = 1, 6 pF $\le C_{L,eff} \le 9$ pF
- For XT1DRIVEx = 2, 6 pF $\le C_{L,eff} \le 10$ pF
- For XT1DRIVEx = 3, $C_{L,eff} \ge 6$ pF

(5) Includes parasitic bond and package capacitance (approximately 2 pF per pin).
Because the PCB adds additional capacitance, verify the correct load by measuring the ACLK frequency. For a correct setup, the effective load capacitance should always match the specification of the used crystal.

(6) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.

(7) Frequencies below the MIN specification set the fault flag. Frequencies above the MAX specification do not set the fault flag. Frequencies between the MIN and MAX specifications might set the flag.

(8) Measured with logic-level input frequency but also applies to operation with crystals.

(1) Requires external capacitors at both terminals. Values are specified by crystal manufacturers.
(2) To improve EMI on the XT2 oscillator the following guidelines should be observed.
- Keep the traces between the device and the crystal as short as possible.
- Design a good ground plane around the oscillator pins.
- Prevent crosstalk from other clock or data lines into oscillator pins XT2IN and XT2OUT.
- Avoid running PCB traces underneath or adjacent to the XT2IN and XT2OUT pins.
- Use assembly materials and processes that avoid any parasitic load on the oscillator XT2IN and XT2OUT pins.
- If conformal coating is used, make sure that it does not induce capacitive or resistive leakage between the oscillator pins.

(3) This represents the maximum frequency that can be input to the device externally. Maximum frequency achievable on the device operation is based on the frequencies present on ACLK, MCLK, and SMCLK cannot be exceed for a given range of operation.
(4) When XT2BYPASS is set, the XT2 circuit is automatically powered down. Input signal is a digital square-wave with parametrics defined in the Schmitt-trigger Inputs section of this data sheet. When in crystal bypass mode, XT2IN can be configured so that it can support an input digital waveform with swing levels from DVSS to DVCC (XT2BYPASSLV = 0) or DVSS to DVIO (XT2BYPASSLV = 1). In this case, it is required that the pin be configured properly for the intended input swing.

(1) When selecting the proper DCO frequency range (DCORSELx), the target DCO frequency, f_{DCO}, should be set to reside within the range of $f_{DCO(n,\ 0),MAX} \le f_{DCO} \le f_{DCO(n,\ 31),MIN}$, where $f_{DCO(n,\ 0),MAX}$ represents the maximum frequency specified for the DCO frequency, range n, tap 0 (DCOx = 0) and $f_{DCO(n,31),MIN}$ represents the minimum frequency specified for the DCO frequency, range n, tap 31 (DCOx = 31). This ensures that the target DCO frequency resides within the range selected. It should also be noted that if the actual f_{DCO} frequency for the selected range causes the FLL or the application to select tap 0 or 31, the DCO fault flag is set to report that the selected range is at its minimum or maximum tap setting.
(2) Calculated using the box method: (MAX(–40°C to 85°C) – MIN(–40°C to 85°C)) / MIN(–40°C to 85°C) / (85°C – (–40°C))

5.32 Wake-up Times From Low-Power Modes and Reset

over recommended ranges of supply voltage and operating free-air temperature (unless otherwise noted)

PARAMETER		TEST CONDITIONS		MIN	TYP	MAX	UNIT
$t_{WAKE-UP-FAST}$	Wake-up time from LPM2, LPM3, or LPM4 to active mode(1)	PMMCOREV = SVSMLRRL = n (where n = 0, 1, 2, or 3), SVSLFP = 1	f_{MCLK} ≥ 4.0 MHz		3.5	7.5	µs
			1.0 MHz < f_{MCLK} < 4.0 MHz		4.5	9	
$t_{WAKE-UP-SLOW}$	Wake-up time from LPM2, LPM3 or LPM4 to active mode(2)(3)	PMMCOREV = SVSMLRRL = n (where n = 0, 1, 2, or 3), SVSLFP = 0			150	175	µs
$t_{WAKE-UP-LPM5}$	Wake-up time from LPM4.5 to active mode(4)				2	3	ms
$t_{WAKE-UP-RESET}$	Wake-up time from $\overline{RST}$ or BOR event to active mode(4)				2	3	ms

(1) This value represents the time from the wake-up event to the first active edge of MCLK. The wake-up time depends on the performance mode of the low-side supervisor (SVS_L) and low-side monitor (SVM_L). $t_{WAKE-UP-FAST}$ is possible with SVS_L and SVM_L in full performance mode or disabled. For specific register settings, see the *Low-Side SVS and SVM Control and Performance Mode Selection* section in the *Power Management Module and Supply Voltage Supervisor* chapter of the *MSP430x5xx and MSP430x6xx Family User's Guide*.

(2) This value represents the time from the wake-up event to the first active edge of MCLK. The wake-up time depends on the performance mode of the low-side supervisor (SVS_L) and low-side monitor (SVM_L). $t_{WAKE-UP-SLOW}$ is set with SVS_L and SVM_L in normal mode (low current mode). For specific register settings, see the *Low-Side SVS and SVM Control and Performance Mode Selection* section in the *Power Management Module and Supply Voltage Supervisor* chapter of the *MSP430x5xx and MSP430x6xx Family User's Guide*.

(3) The wake-up times from LPM0 and LPM1 to AM are not specified. They are proportional to MCLK cycle time but are not affected by the performance mode settings as for LPM2, LPM3, and LPM4.

(4) This value represents the time from the wake-up event to the reset vector execution.

5.33 Timer_A

(1) The external reference is used during ADC conversion to charge and discharge the capacitance array. The input capacitance, C_I, is also the dynamic load for an external reference during conversion. The dynamic impedance of the reference supply should follow the recommendations on analog-source impedance to allow the charge to settle for 10-bit accuracy.
(2) The accuracy limits the minimum positive external reference voltage. Lower reference voltage levels may be applied with reduced accuracy requirements.
(3) The accuracy limits the maximum negative external reference voltage. Higher reference voltage levels may be applied with reduced accuracy requirements.
(4) The accuracy limits minimum external differential reference voltage. Lower differential reference voltage levels may be applied with reduced accuracy requirements.
(5) Two decoupling capacitors, 10 µF and 100 nF, should be connected to VREF to decouple the dynamic current required for an external reference source if it is used for the ADC10_A. See also the *MSP430x5xx and MSP430x6xx Family User's Guide*.

(1) The leakage current is defined in the leakage current table with P6.x/Ax parameter.
(2) The internal reference current is supplied from terminal AVCC. Consumption is independent of the ADC10ON control bit, unless a conversion is active. The REFON bit enables to settle the built-in reference before starting an A/D conversion.
(3) Calculated using the box method: (MAX(–40°C to 85°C) – MIN(–40°C to 85°C)) / MIN(–40°C to 85°C)/(85°C – (–40°C)).
(4) The sensor current I_{SENSOR} is consumed if (ADC10ON = 1 and REFON = 1) or (ADC10ON = 1 and INCH = 0Ah and sample signal is high). When REFON = 1, I_{SENSOR} is already included in I_{REF+}.
(5) The temperature sensor offset can be significant. TI recommends a single-point calibration to minimize the offset error of the built-in temperature sensor.
(6) The typical equivalent impedance of the sensor is 51 kΩ. The sample time required includes the sensor-on time $t_{SENSOR(on)}$.
(7) The on-time $t_{VMID(on)}$ is included in the sampling time $t_{VMID(sample)}$; no additional on time is needed.
(8) The condition is that the error in a conversion started after t_{REFON} is less than ±0.5 LSB.

6 Detailed Description

6.1 CPU (Link to user's guide)

The MSP430 CPU has a 16-bit RISC architecture that is highly transparent to the application. All operations, other than program-flow instructions, are performed as register operations in conjunction with seven addressing modes for source operand and four addressing modes for destination operand.

The CPU is integrated with 16 registers that provide reduced instruction execution time. The register-to-register operation execution time is one cycle of the CPU clock. Four of the registers, R0 to R3, are dedicated as program counter, stack pointer, status register, and constant generator, respectively. The remaining registers are general-purpose registers (see Figure 6-1).

Peripherals are connected to the CPU using data, address, and control buses. Peripherals can be managed with all instructions.

The instruction set consists of the original 51 instructions with three formats and seven address modes and additional instructions for the expanded address range. Each instruction can operate on word and byte data.

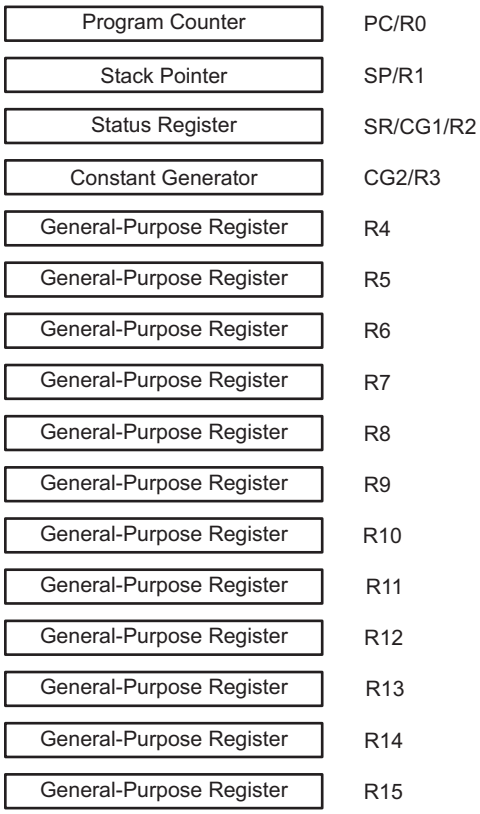

Figure 6-1. Integrated CPU Registers

6.2 Operating Modes

These MCUs have one active mode and six software-selectable low-power modes of operation. An interrupt event can wake up the device from any of the low-power modes, service the request, and restore back to the low-power mode on return from the interrupt program.

Software can configure the following seven operating modes:

- Active mode (AM)
  - All clocks are active
- Low-power mode 0 (LPM0)
  - CPU is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
  - FLL loop control remains active
- Low-power mode 1 (LPM1)
  - CPU is disabled
  - FLL loop control is disabled
  - ACLK and SMCLK remain active, MCLK is disabled
- Low-power mode 2 (LPM2)
  - CPU is disabled
  - MCLK and FLL loop control and DCOCLK are disabled
  - DC generator of the DCO remains enabled
  - ACLK remains active
- Low-power mode 3 (LPM3)
  - CPU is disabled
  - MCLK, FLL loop control, and DCOCLK are disabled
  - DC generator of the DCO is disabled
  - ACLK remains active
- Low-power mode 4 (LPM4)
  - CPU is disabled
  - ACLK is disabled
  - MCLK, FLL loop control, and DCOCLK are disabled
  - DC generator of the DCO is disabled
  - Crystal oscillator is stopped
  - Complete data retention
- Low-power mode 4.5 (LPM4.5)
  - Internal regulator disabled
  - No data retention
  - Wake-up input from $\overline{\text{RST}}$/NMI, P1, or P2

6.3 Interrupt Vector Addresses

The interrupt vectors and the power-up start address are in the address range 0FFFFh to 0FF80h (see Table 6-1). The vector contains the 16-bit address of the interrupt-handler instruction sequence.

6.5 Bootloader (BSL)

NOTE

Devices from TI come factory programmed with either an I^2C-based BSL or a timer-based UART BSL. See Table 3-1 to determine which BSL type is implemented.

6.5.1 Bootloader – I^2C

The I^2C BSL enables users to program the flash memory or RAM using a I^2C serial interface. Access to the device memory through the BSL is protected by an user-defined password.

When using the BSL, it requires a specific entry sequence on the $\overline{\text{RST}}$/NMI and BSLEN pins. Table 6-3 lists the required pins and their functions. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*. For a complete description of the features of the BSL and its implementation, see the *MSP430 Flash Device Bootloader (BSL) User's Guide*. BSL firmware images are available for download in the Custom BSL430 package.

NOTE

To invoke the BSL from the DVIO domain, the $\overline{\text{RST}}$/NMI pin and BSLEN pins must be used for the entry sequence. It is critical not to confuse the $\overline{\text{RST}}$/NMI pin with the $\overline{\text{RSTDVCC}}$/SBWTDIO pin. In many other MSP430 devices, SBWTDIO is shared with the $\overline{\text{RST}}$/NMI pin, and $\overline{\text{RSTDVCC}}$ does not exist. Additional information can be found in *Designing With MSP430F522x and MSP430F521x Devices*.

Table 6-3. BSL Pin Requirements and Functions

DEVICE SIGNAL	BSL FUNCTION
$\overline{\text{RST}}$/NMI	External reset
BSLEN	Enable BSL
P4.1/PM_UCB1SDA	I^2C data
P4.2/ PM_UCB1SCL	I^2C clock
DVCC, AVCC	Device power supply
DVIO	I/O power supply
DVSS	Ground supply

6.5.2 Bootloader – UART

The UART BSL enables users to program the flash memory or RAM using a UART serial interface. Access to the device memory through the BSL is protected by an user-defined password. Because the F525x have split I/O power domains, it is possible to interface with the BSL from either the DVCC or DVIO supply domains. This is useful when the MSP430 is interfacing to a host on the DVIO supply domain. The BSL interface on the DVIO supply domain (see Table 6-5) uses the USCI_A0 module configured as a UART. The BSL interface on the DVCC supply domain (see Table 6-4) uses a timer-based UART.

For applications that have BSL communication based on the DVCC supply domain, entry to the BSL requires a specific sequence on the $\overline{\text{RSTDVCC}}$/SBWTDIO and TEST/SBWTCK pins.

NOTE

Devices that are factory programmed with an UART BSL use the DVCC power supply domain pin configuration per default (see Table 6-4).

NOTE

To invoke the BSL from the DVCC domain, the $\overline{\text{RSTDVCC}}$/SBWTDIO pin and TEST/SBWTCK pin must be used for the entry sequence. It is critical not to confuse the $\overline{\text{RST}}$/NMI pin with the $\overline{\text{RSTDVCC}}$/SBWTDIO pin. In many other MSP430 devices, SBWTDIO is shared with the $\overline{\text{RST}}$/NMI pin, and $\overline{\text{RSTDVCC}}$ does not exist. Additional information can be found in *Designing With MSP430F522x and MSP430F521x Devices*.

Table 6-4. DVCC BSL Pin Requirements and Functions

DEVICE SIGNAL	BSL FUNCTION
$\overline{\text{RSTDVCC}}$/SBWTDIO	External reset
TEST/SBWTCK	Enable BSL
P6.1	Data transmit
P6.2	Data receive
DVCC, AVCC	Device power supply
DVIO	I/O power supply
DVSS	Ground supply

When using the DVIO supply domain for the BSL, entry to the BSL requires a specific sequence on the $\overline{\text{RST}}$/NMI and BSLEN pins. Table 6-5 lists the required pins and their functions. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*. For a complete description of the features of the BSL and its implementation, see the *MSP430 Flash Device Bootloader (BSL) User's Guide*. BSL firmware images are available for download in the Custom BSL430 package. The BSL on the DVIO supply domain uses the USCI_A0 module configured as a UART.

NOTE

To invoke the BSL from the DVIO domain, the $\overline{\text{RST}}$/NMI pin and the BSLEN pin must be used for the entry sequence (see Section 5.49). It is critical not to confuse the $\overline{\text{RST}}$/NMI pin with the $\overline{\text{RSTDVCC}}$/SBWTDIO pin. In many other MSP430 devices, SBWTDIO is shared with the $\overline{\text{RST}}$/NMI pin, and $\overline{\text{RSTDVCC}}$ does not exist. Additional information can be found in *Designing With MSP430F522x and MSP430F521x Devices*.

6.6 JTAG Operation

6.6.1 JTAG Standard Interface

The MSP430 family supports the standard JTAG interface which requires four signals for sending and receiving data. The JTAG signals are shared with general-purpose I/O. The TEST/SBWTCK pin is used to enable the JTAG signals. In addition to these signals, the $\overline{\text{RSTDVCC}}$/SBWTDIO is required to interface with MSP430 development tools and device programmers. Table 6-6 lists the JTAG pin requirements. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*. For a complete description of the features of the JTAG interface and its implementation, see *MSP430 Programming With the JTAG Interface*. Additional information can be found in *Designing With MSP430F522x and MSP430F521x Devices*.

NOTE

All JTAG I/O pins are supplied by DVCC.

NOTE

Traditionally, on other MSP430 devices, the $\overline{\text{RST}}$/NMI pin is used for SBWTDIO, so care must be taken not to mistakenly use the incorrect pin. On the F525x series of devices, it is required to use $\overline{\text{RSTDVCC}}$ for SBWTDIO as shown in Table 6-6. Additional information can be found in *Designing With MSP430F522x and MSP430F521x Devices*.

6.6.2 Spy-Bi-Wire Interface

In addition to the standard JTAG interface, the MSP430 family supports the two wire Spy-Bi-Wire interface. Spy-Bi-Wire can be used to interface with MSP430 development tools and device programmers. Table 6-7 lists the Spy-Bi-Wire interface pin requirements. For further details on interfacing to development tools and device programmers, see the *MSP430 Hardware Tools User's Guide*. For a complete description of the features of the JTAG interface and its implementation, see *MSP430 Programming With the JTAG Interface*. Additional information can be found in *Designing With MSP430F522x and MSP430F521x Devices*.

NOTE

All SBW I/O pins are supplied by DVCC.

NOTE

Traditionally, on other MSP430 devices, the $\overline{\text{RST}}$/NMI pin is used for SBWTDIO, so care must be taken not to mistakenly use the incorrect pin. On the F525x series of devices, it is required to use $\overline{\text{RSTDVCC}}$ for SBWTDIO as shown in Table 6-7. Additional information can be found in *Designing With MSP430F522x and MSP430F521x Devices*.

6.7 Flash Memory (Link to user's guide)

The flash memory can be programmed through the JTAG port, Spy-Bi-Wire (SBW), the BSL, or in-system by the CPU. The CPU can perform single-byte, single-word, and long-word writes to the flash memory. Features of the flash memory include:

- Flash memory has n segments of main memory and four segments of information memory (A to D) of 128 bytes each. Each segment in main memory is 512 bytes in size.
- Segments 0 to n may be erased in one step, or each segment may be individually erased.
- Segments A to D can be erased individually. Segments A to D are also called *information memory*.
- Segment A can be locked separately.

6.8 RAM (Link to user's guide)

The RAM is made up of n sectors. Each sector can be completely powered down to reduce leakage; however, all data are lost during power down.

Features of the RAM include:

- RAM memory has n sectors. The sizes of the sectors can be found in Section 6.4, *Memory Organization*.
- Each sector 0 to n can be complete disabled; however, all data in a sector are lost when it is disabled.
- Each sector 0 to n automatically enters low-power retention mode when possible.

6.9 Peripherals

Peripherals are connected to the CPU through data, address, and control buses. Peripherals can be managed using all instructions. For complete module descriptions, see the *MSP430F5xx and MSP430F6xx Family User's Guide*.

6.9.1 Digital I/O *(Link to user's guide)*

- All individual I/O bits are independently programmable.
- Any combination of input, output, and interrupt conditions is possible.
- Pullup or pulldown on all ports is programmable.
- Drive strength on all ports is programmable.
- Edge-selectable interrupt and LPM4.5 wake-up input capability is available for all bits of ports P1, P2.
- All bits of port P6 support edge-selectable interrupt input.
- All instructions support read and write access to port-control registers.
- Ports can be accessed byte-wise or word-wise in pairs.

6.9.2 Port Mapping Controller *(Link to user's guide)*

The port mapping controller allows the flexible and reconfigurable mapping of digital functions to port P4 (see Table 6-8).

6.9.3 Oscillator and System Clock (Link to user's guide)

The clock system is supported by the Unified Clock System (UCS) module, which includes support for a 32-kHz watch crystal oscillator (XT1 LF mode; XT1 HF mode is not supported), an internal very-low-power low-frequency oscillator (VLO), an internal trimmed low-frequency oscillator (REFO), an integrated internal digitally controlled oscillator (DCO), and a high-frequency crystal oscillator (XT2). The UCS module is designed to meet the requirements of both low system cost and low power consumption. The UCS module features digital frequency locked loop (FLL) hardware that, in conjunction with a digital modulator, stabilizes the DCO frequency to a programmable multiple of the selected FLL reference frequency. The internal DCO provides a fast turnon clock source and stabilizes in 3.5 µs (typical). The UCS module provides the following clock signals:

- Auxiliary clock (ACLK), sourced from a 32-kHz watch crystal (XT1), a high-frequency crystal (XT2), the internal low-frequency oscillator (VLO), the trimmed low-frequency oscillator (REFO), or the internal digitally controlled oscillator DCO.
- Main clock (MCLK), the system clock used by the CPU. MCLK can be sourced by same sources made available to ACLK.
- Sub-Main clock (SMCLK), the subsystem clock used by the peripheral modules. SMCLK can be sourced by same sources made available to ACLK.
- ACLK/n, the buffered output of ACLK, ACLK/2, ACLK/4, ACLK/8, ACLK/16, ACLK/32.

6.9.4 Power-Management Module (PMM) (Link to user's guide)

The PMM includes an integrated voltage regulator that supplies the core voltage to the device and contains programmable output levels to provide for power optimization. The PMM also includes supply voltage supervisor (SVS) and supply voltage monitoring (SVM) circuitry, and brownout protection. The brownout circuit is implemented to provide the proper internal reset signal to the device during power-on and power-off. The SVS and SVM circuitry detects if the supply voltage drops below a user-selectable level and supports both supply voltage supervision (the device is automatically reset) and supply voltage monitoring (the device is not automatically reset). SVS and SVM circuitry is available on the primary supply and core supply.

6.9.5 Hardware Multiplier (Link to user's guide)

The multiplication operation is supported by a dedicated peripheral module. The module performs operations with 32-, 24-, 16-, and 8-bit operands. The module supports signed and unsigned multiplication as well as signed and unsigned multiply-and-accumulate operations.

6.9.6 Real-Time Clock (RTC_A) (Link to user's guide)

The RTC_A module can be used as a general-purpose 32-bit counter (counter mode) or as an integrated real-time clock (RTC) (calendar mode). In counter mode, the RTC_A also includes two independent 8-bit timers that can be cascaded to form a 16-bit timer or counter. Both timers can be read and written by software. Calendar mode integrates an internal calendar that compensates for months with less than 31 days and includes leap year correction. The RTC_A also supports flexible alarm functions and offset-calibration hardware.

6.9.7 Watchdog Timer (WDT_A) (Link to user's guide)

The primary function of the WDT_A module is to perform a controlled system restart after a software problem occurs. If the selected time interval expires, a system reset is generated. If the watchdog function is not needed in an application, the module can be configured as an interval timer and can generate interrupts at selected time intervals.

6.9.8 System Module (SYS) (Link to user's guide)

The SYS module handles many of the system functions within the device. These functions include power-on reset (POR) and power-up clear (PUC) handling, NMI source selection and management, reset interrupt vector generators, bootloader (BSL) entry mechanisms, and configuration management (device descriptors). The SYS module also includes a data exchange mechanism using JTAG that is called a JTAG mailbox and that can be used in the application. Table 6-10 lists the SYS module interrupt vector registers.

6.9.9 DMA Controller (Link to user's guide)

The DMA controller allows movement of data from one memory address to another without CPU intervention. For example, the DMA controller can be used to move data from the ADC10_A conversion memory to RAM. Using the DMA controller can increase the throughput of peripheral modules. The DMA controller reduces system power consumption by allowing the CPU to remain in sleep mode, without having to awaken to move data to or from a peripheral (see Table 6-11).

6.9.10 Universal Serial Communication Interface (USCI) (Links to user's guide: UART Mode, SPI Mode, I²C Mode)

The USCI modules are used for serial data communication. The USCI module supports synchronous communication protocols such as SPI (3- or 4-pin) and I²C, and asynchronous communication protocols such as UART, enhanced UART with automatic baud-rate detection, and IrDA. Each USCI module contains two portions, A and B.

The USCI_An module provides support for SPI (3- or 4-pin), UART, enhanced UART, or IrDA.

The USCI_Bn module provides support for SPI (3- or 4-pin) or I²C.

The MSP430F525x include four complete USCI modules (n = 0, 1, 2, 3).

6.9.11 TA0 (Link to user's guide)

TA0 is a 16-bit timer/counter (Timer_A type) with five capture/compare registers. TA0 supports multiple captures or compares, PWM outputs, and interval timing (see Table 6-12). TA0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.9.12 TA1 (Link to user's guide)

TA1 is a 16-bit timer/counter (Timer_A type) with three capture/compare registers. TA1 supports multiple captures or compares, PWM outputs, and interval timing (see Table 6-13). TA1 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.9.13 TA2 (Link to user's guide)

TA2 is a 16-bit timer/counter (Timer_A type) with three capture/compare registers. TA2 supports multiple captures or compares, PWM outputs, and interval timing (see Table 6-14). TA2 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

6.9.14 TB0 (Link to user's guide)

TB0 is a 16-bit timer/counter (Timer_B type) with seven capture/compare registers. TB0 supports multiple captures or compares, PWM outputs, and interval timing (see Table 6-15). TB0 also has extensive interrupt capabilities. Interrupts may be generated from the counter on overflow conditions and from each of the capture/compare registers.

(1) Timer functions can be selected by the port mapping controller.

6.9.15 Comparator_B (Link to user's guide)

The primary function of the Comparator_B module is to support precision slope analog-to-digital conversions, battery voltage supervision, and monitoring of external analog signals.

6.9.16 ADC10_A (Link to user's guide)

The ADC10_A module supports fast 10-bit analog-to-digital conversions. The module implements a 10-bit SAR core, sample select control, reference generator, and a conversion result buffer. A window comparator with lower and upper limits allows CPU-independent result monitoring with three window comparator interrupt flags.

6.9.17 CRC16 (Link to user's guide)

The CRC16 module produces a signature based on a sequence of entered data values and can be used for data checking purposes. The CRC16 module signature is based on the CRC-CCITT standard.

6.9.18 Reference (REF) Module Voltage Reference (Link to user's guide)

The REF module generates all of the critical reference voltages that can be used by the various analog peripherals in the device.

6.9.19 Embedded Emulation Module (EEM) (S Version) (Link to user's guide)

The EEM supports real-time in-system debugging. The S version of the EEM has the following features:

- Three hardware triggers or breakpoints on memory access
- One hardware trigger or breakpoint on CPU register write access
- Up to four hardware triggers can be combined to form complex triggers or breakpoints
- One cycle counter
- Clock control on module level

6.9.20 Peripheral File Map

Table 6-16 lists the base address for the registers of each peripheral module.

(1) X = Don't care
(2) The pin direction is controlled by the USCI module.
(3) UCB3CLK function takes precedence over UCA3STE function. If the pin is required as UCB3CLK input or output, USCI A3 is forced to 3-wire SPI mode if 4-wire SPI mode is selected.
(4) UCA3CLK function takes precedence over UCB3STE function. If the pin is required as UCA3CLK input or output, USCI_B3 is forced to 3-wire SPI mode if 4-wire SPI mode is selected.
(5) UCA0CLK function takes precedence over UCB0STE function. If the pin is required as UCA0CLK input or output, USCI_B0 is forced to 3-wire SPI mode if 4-wire SPI mode is selected.

(1) X = Don't care
(2) The pin direction is controlled by the USCI module.
(3) If the I^2C functionality is selected, the output drives only the logical 0 to V_{SS} level.
(4) UCB0CLK function takes precedence over UCA0STE function. If the pin is required as UCB0CLK input or output, USCI_A0 is forced to 3-wire SPI mode if 4-wire SPI mode is selected.

		A9/VeREF–(5)	X	1	0

(1) X = Don't care
(2) REFOUT resides in the REF module.
(3) Default condition
(4) Setting the P5SEL.0 bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. An external voltage can be applied to VeREF+ and used as the reference for the ADC10_A. Channel A8, when selected with the INCHx bits, is connected to the VeREF+ pin.
(5) Setting the P5SEL.1 bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. An external voltage can be applied to VeREF- and used as the reference for the ADC10_A. Channel A9, when selected with the INCHx bits, is connected to the VeREF- pin.

		XT2OUT crystal mode(3)	X	1	X	0
		P5.3 (I/O)(3)	X	1	0	1

(1) X = Don't care
(2) Setting P5SEL.2 causes the general-purpose I/O to be disabled. Pending the setting of XT2BYPASS, P5.2 is configured for crystal mode or bypass mode.
(3) Setting P5SEL.2 causes the general-purpose I/O to be disabled in crystal mode. When using bypass mode, P5.3 can be used as general-purpose I/O.

		XOUT crystal mode(3)	X	1	X	0
		P5.5 (I/O)(3)	X	1	0	1

(1) X = Don't care
(2) Setting P5SEL.4 causes the general-purpose I/O to be disabled. Pending the setting of XT1BYPASS, P5.4 is configured for crystal mode or bypass mode.
(3) Setting P5SEL.4 causes the general-purpose I/O to be disabled in crystal mode. When using bypass mode, P5.5 can be used as general-purpose I/O.

P6.7/CB7/(A7)	7	P6.7 (I/O)	I: 0; O: 1	0	0
		A7	X	X	1
		CB7(1)	X	X	1

(1) Setting the CBPD.x bit disables the output driver and the input Schmitt trigger to prevent parasitic cross currents when applying analog signals. Selecting the CBx input pin to the comparator multiplexer with the CBx bits automatically disables output driver and input buffer for that pin, regardless of the state of the associated CBPD.x bit.

6.10.9 Port P7 (P7.0 to P7.5) Input/Output With Schmitt Trigger

P7.5/UCB2STE/UCA2CLK(1)	5	P7.5 (I/O)	I: 0; O: 1	0
		UCB2STE/UCA2CLK(2)	X	1

(1) The pin direction is controlled by the USCI module.
(2) Setting P7SEL.x bit disables the output driver and the input Schmitt trigger.
(3) UCB2CLK function takes precedence over UCA2STE function. If the pin is required as UCB2CLK input or output, USCI_A2 is forced to 3-wire SPI mode if 4-wire SPI mode is selected.
(4) If the I^2C functionality is selected, the output drives only the logical 0 to V_{SS} level.

7 Device and Documentation Support

7.1 Getting Started and Next Steps

For more information on the MSP430™ family of devices and the tools and libraries that are available to help with your development, visit the MSP430 ultra-low-power sensing and measurement MCUs overview.

7.2 Device Nomenclature

To designate the stages in the product development cycle, TI assigns prefixes to the part numbers of all MSP MCU devices. Each MSP MCU commercial family member has one of two prefixes: MSP or XMS. These prefixes represent evolutionary stages of product development from engineering prototypes (XMS) through fully qualified production devices (MSP).

XMS – Experimental device that is not necessarily representative of the final device's electrical specifications

MSP – Fully qualified production device

XMS devices are shipped against the following disclaimer:

"Developmental product is intended for internal evaluation purposes."

MSP devices have been characterized fully, and the quality and reliability of the device have been demonstrated fully. TI's standard warranty applies.

Predictions show that prototype devices (XMS) have a greater failure rate than the standard production devices. TI recommends that these devices not be used in any production system because their expected end-use failure rate still is undefined. Only qualified production devices are to be used.

TI device nomenclature also includes a suffix with the device family name. This suffix indicates the temperature range, package type, and distribution format. Figure 7-1 provides a legend for reading the complete device name.

7.3 Tools and Software

All MSP microcontrollers are supported by a wide variety of software and hardware development tools. Tools are available from TI and various third parties. See them all at MSP430 Ultra-Low-Power MCUs – Tools & software.

Table 7-1 lists the debug features of the MSP430F522x MCUs. See the *Code Composer Studio for MSP430 User's Guide* for details on the available features.

Design Kits and Evaluation Modules

64-Pin Target Development Board and MSP-FET Programmer Bundle for MSP430F5x MCUs The MSP-FET430U64C is a powerful tool that includes the hardware and software required to complete much of your application development work. The flash memory can be erased and programmed in seconds with only a few keystrokes, and since the MSP430 flash is extremely low power, no external power supply is required.

64-Pin Target Development Board for MSP430F5x MCUs The MSP-TS430RGC64C is a stand-alone 64-pin ZIF socket target board used to program and debug the MSP430 MCU in-system through the JTAG interface or the Spy Bi-Wire (2-wire JTAG) protocol.

Dual-Mode Bluetooth CC2564 Module with Integrated Antenna Evaluation Board The CC2564MODAEM evaluation board contains the Bluetooth BR/EDR/LE HCI solution. Based on TI's CC2564B dual-mode Bluetooth single-chip device, the bCC2564MODA is intended for evaluation and design purposes, reducing design effort and enabling fast time to market.

Software

MSP430Ware™ Software MSP430Ware software is a collection of code examples, data sheets, and other design resources for all MSP430 devices delivered in a convenient package. In addition to providing a complete collection of existing MSP430 MCU design resources, MSP430Ware software also includes a high-level API called MSP Driver Library. This library makes it easy to program MSP430 hardware. MSP430Ware software is available as a component of CCS or as a stand-alone package.

MSP430F525x Code Examples C code examples that configure each of the integrated peripherals for various application needs.

MSP Driver Library Driver Library's abstracted API keeps you above the bits and bytes of the MSP430 hardware by providing easy-to-use function calls. Thorough documentation is delivered through a helpful API Guide, which includes details on each function call and the recognized parameters. Developers can use Driver Library functions to write complete projects with minimal overhead.

MSP EnergyTrace™ Technology EnergyTrace technology for MSP430 microcontrollers is an energy-based code analysis tool that measures and displays the application's energy profile and helps to optimize it for ultra-low-power consumption.

ULP (Ultra-Low Power) Advisor ULP Advisor™ software is a tool for guiding developers to write more efficient code to fully utilize the unique ultra-low power features of MSP and MSP432 microcontrollers. Aimed at both experienced and new microcontroller developers, ULP Advisor checks your code against a thorough ULP checklist to squeeze every last nano amp out of your application. At build time, ULP Advisor will provide notifications and remarks to highlight areas of your code that can be further optimized for lower power.

IEC60730 Software Package The IEC60730 MSP430 software package was developed to be useful in assisting customers in complying with IEC 60730-1:2010 (Automatic Electrical Controls for Household and Similar Use – Part 1: General Requirements) for up to Class B products, which includes home appliances, arc detectors, power converters, power tools, e-bikes, and many others. The IEC60730 MSP430 software package can be embedded in customer applications running on MSP430s to help simplify the customer's certification efforts of functional safety-compliant consumer devices to IEC 60730-1:2010 Class B.

Fixed Point Math Library for MSP The MSP IQmath and Qmath Libraries are a collection of highly optimized and high-precision mathematical functions for C programmers to seamlessly port a floating-point algorithm into fixed-point code on MSP430 and MSP432 devices. These routines are typically used in computationally intensive real-time applications where optimal execution speed, high accuracy, and ultra-low energy are critical. By using the IQmath and Qmath libraries, it is possible to achieve execution speeds considerably faster and energy consumption considerably lower than equivalent code written using floating-point math.

Floating Point Math Library for MSP430 Continuing to innovate in the low power and low cost microcontroller space, TI brings you MSPMATHLIB. Leveraging the intelligent peripherals of our devices, this floating point math library of scalar functions brings you up to 26x better performance. Mathlib is easy to integrate into your designs. This library is free and is integrated in both Code Composer Studio and IAR IDEs. Read the user's guide for an in depth look at the math library and relevant benchmarks.

Development Tools

Code Composer Studio™ Integrated Development Environment for MSP Microcontrollers Code Composer Studio is an integrated development environment (IDE) that supports all MSP microcontroller devices. Code Composer Studio comprises a suite of embedded software utilities used to develop and debug embedded applications. It includes an optimizing C/C++ compiler, source code editor, project build environment, debugger, profiler, and many other features. The intuitive IDE provides a single user interface taking you through each step of the application development flow. Familiar utilities and interfaces allow users to get started faster than ever before. Code Composer Studio combines the advantages of the Eclipse software framework with advanced embedded debug capabilities from TI resulting in a compelling feature-rich development environment for embedded developers.

Command-Line Programmer MSP Flasher is an open-source shell-based interface for programming MSP microcontrollers through a FET programmer or eZ430 using JTAG or Spy-Bi-Wire (SBW) communication. MSP Flasher can download binary files (.txt or .hex) files directly to the MSP microcontroller without an IDE.

MSP MCU Programmer and Debugger The MSP-FET is a powerful emulation development tool – often called a debug probe – which allows users to quickly begin application development on MSP low-power microcontrollers (MCU). Creating MCU software usually requires downloading the resulting binary program to the MSP device for validation and debugging. The MSP-FET provides a debug communication pathway between a host computer and the target MSP. Furthermore, the MSP-FET also provides a Backchannel UART connection between the computer's USB interface and the MSP UART. This affords the MSP programmer a convenient method for communicating serially between the MSP and a terminal running on the computer.

MSP-GANG Production Programmer The MSP Gang Programmer is an MSP430 or MSP432 device programmer that can program up to eight identical MSP430 or MSP432 Flash or FRAM devices at the same time. The MSP Gang Programmer connects to a host PC using a standard RS-232 or USB connection and provides flexible programming options that allow the user to fully customize the process. The MSP Gang Programmer is provided with an expansion board, called the Gang Splitter, that implements the interconnections between the MSP Gang Programmer and multiple target devices. Eight cables are provided that connect the expansion board to eight target devices (through JTAG or Spy-Bi-Wire connectors). The programming can be done with a PC or as a stand-alone device.

7.4 Documentation Support

The following documents describe the MSP430F525x devices. Copies of these documents are available on the Internet at www.ti.com.

Receiving Notification of Document Updates

To receive notification of documentation updates—including silicon errata—go to the product folder for your device on ti.com (for links to the product folders, see Section 7.5). In the upper right corner, click the "Alert me" button. This registers you to receive a weekly digest of product information that has changed (if any). For change details, check the revision history of any revised document.

User's Guides

MSP430F5xx and MSP430F6xx Family User's Guide Detailed information on the modules and peripherals available in this device family.

MSP430 Flash Device Bootloader (BSL) User's Guide The MSP430 bootloader (BSL, formerly known as the bootstrap loader) allows users to communicate with embedded memory in the MSP430 microcontroller during the prototyping phase, final production, and in service. Both the programmable memory (flash memory) and the data memory (RAM) can be modified as required. Do not confuse the bootloader with the bootstrap loader programs found in some digital signal processors (DSPs) that automatically load program code (and data) from external memory to the internal memory of the DSP.

MSP430 Programming With the JTAG Interface This document describes the functions that are required to erase, program, and verify the memory module of the MSP430 flash-based and FRAM-based microcontroller families using the JTAG communication port. In addition, it describes how to program the JTAG access security fuse that is available on all MSP430 devices. This document describes device access using both the standard 4-wire JTAG interface and the 2-wire JTAG interface, which is also referred to as Spy-Bi-Wire (SBW).

MSP430 Hardware Tools User's Guide This manual describes the hardware of the TI MSP-FET430 Flash Emulation Tool (FET). The FET is the program development tool for the MSP430 ultra-low-power microcontroller. Both available interface types, the parallel port interface and the USB interface, are described.

Application Reports

MSP430 32-kHz Crystal Oscillators Selection of the right crystal, correct load circuit, and proper board layout are important for a stable crystal oscillator. This application report summarizes crystal oscillator function and explains the parameters to select the correct crystal for MSP430 ultra-low-power operation. In addition, hints and examples for correct board layout are given. The document also contains detailed information on the possible oscillator tests to ensure stable oscillator operation in mass production.

MSP430 System-Level ESD Considerations System-Level ESD has become increasingly demanding as silicon technology scales to lower voltages and the need for designing cost-effective and ultra-low-power components. This application report addresses three ESD topics to help board designers and OEMs understand and design robust system-level designs: (1) Component-level ESD testing and system-level ESD testing; (2) General design guidelines for system-level ESD protection; (3) Introduction to System Efficient ESD Design (SEED), a co-design methodology of on-board and on-chip ESD protection.

Designing with MSP430F522x and MSP430F521x Devices The MSP430F522x and MSP430F521x devices support a split supply I/O system that is essential in systems in which the MCU is required to interface with external devices (such as sensors or other processors) that operate at different voltage level compared to the MCU device supply. Additionally, the split supply input voltage range of the F522x and F521x devices starts as low as 1.62 V (see the device data sheet specifications), and this allows for nominal 1.8-V I/O interface without the need for external level translation. This application report describes the various design considerations to keep in mind while designing the F522x and F521x devices in an application.

7.8 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

7.9 Export Control Notice

Recipient agrees to not knowingly export or re-export, directly or indirectly, any product or technical data (as defined by the U.S., EU, and other Export Administration Regulations) including software, or any controlled product restricted by other applicable national regulations, received from disclosing party under nondisclosure obligations (if any), or any direct product of such technology, to any destination to which such export or re-export is restricted or prohibited by U.S. or other applicable laws, without obtaining prior authorization from U.S. Department of Commerce and other competent Government authorities to the extent required by those laws.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead/Ball Finish - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead/Ball Finish values may wrap to two lines if the finish value exceeds the maximum column width.

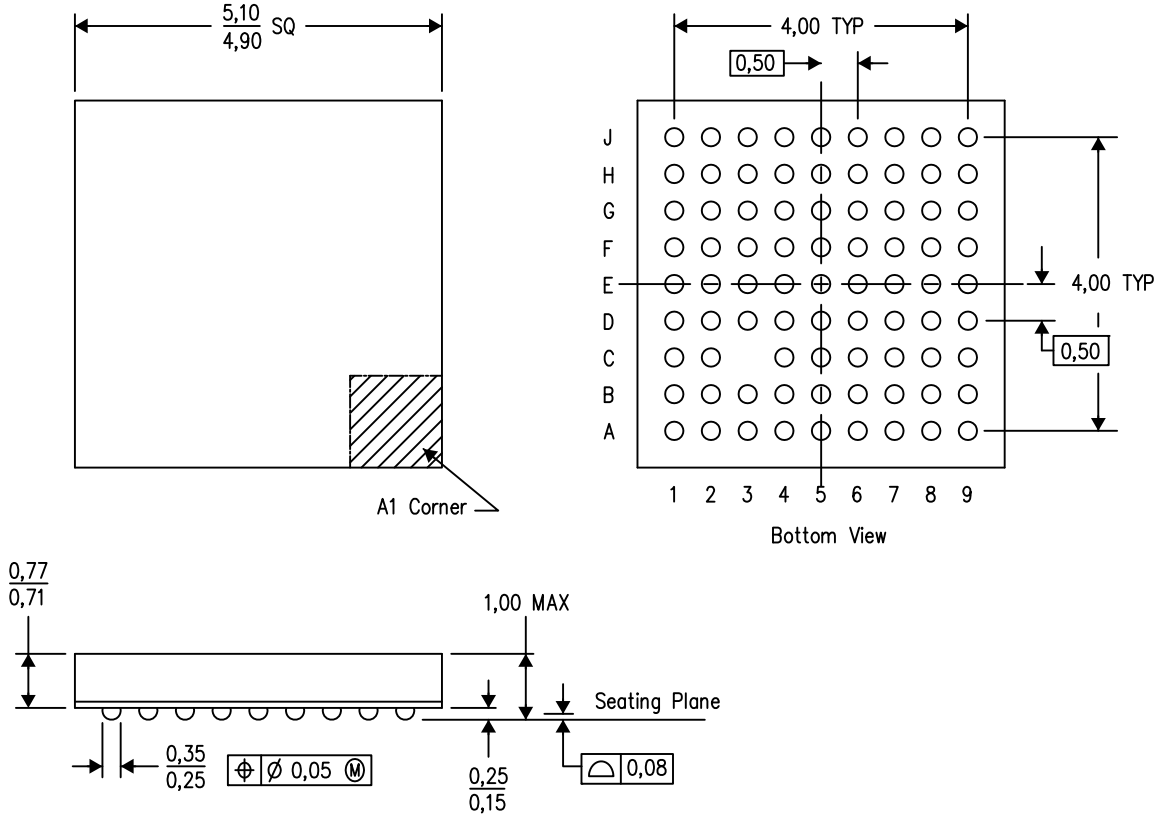
ZQE (S–PBGA–N80) PLASTIC BALL GRID ARRAY



4204334-6/G 09/12

NOTES:
A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M–1994.
B. This drawing is subject to change without notice.
C. Falls within JEDEC MO–225
D. This is a Pb–free solder ball design.

MicroStar Junior is a trademark of Texas Instruments.

PLASTIC QUAD FLATPACK - NO LEAD

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

NOTES: (continued)

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 (www.ti.com/lit/slua271).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
